

SEARCH · MONITORING · JOB ANALYSIS

Work is where the big job boards *don't reach*.

roleorienta brings together jobs from the big job boards and **companies' own career pages**, tracks changes at employers and helps you prepare to apply.

WHY ORDINARY SEARCH ISN'T ENOUGH

You simply don't see some of the jobs that fit

A blind spot

Many employers post jobs **only on their own sites** — they never reach the big job boards. A job that fits exists, but you can't see it where you're used to looking.

A cluttered feed

The big job boards' interfaces are overloaded, the same jobs repeat, and the **source and freshness** of a listing are hard to make out.

You can't cover it by hand

To avoid missing such jobs, you'd have to know dozens of companies, visit their pages regularly and **keep it all in your head**. That's hard to keep up for long.

Everything is scattered

Applications, notes and the history of requirements are spread across spreadsheets and bookmarks. Pulling it all together before an interview is a job in itself.

WHAT ROLEORIENTA DOES

Four things the big job boards do poorly

roleorienta works in depth, not in breadth: around your niche and your employers — and shows exactly what it found.

01

Depth in a narrow niche
Sources are chosen for your specialization and market — nothing extraneous.

02

Monitoring changes
Not a one-off search, but an ongoing watch over companies: how requirements, salary and terms change.

03

Data you can trust
For every job you can see where it came from and when it was last checked. If something isn't stated, it says so — the app doesn't make things up for the source.

04

Every job found at the company
Every job found at the employer is gathered into a technology profile — so you know what to highlight on your CV and in the interview.

HOW IT WORKS

From the first job to the interview result

Four scenarios the product is built for — all in one clear interface.

A FIRST SEARCH

Results right away, not a blank screen

Set your region, specialization, the technologies you need and the work format — and see current jobs right away, from a saved and automatically growing list of employers. Among them will be jobs from career pages. Companies that fit can be added to monitoring.

B SUBSCRIPTION AND MONITORING

Company monitoring — always a current picture

Save a search and pick the companies you care about. From then on the app, **on a schedule you set**, looks for jobs according to your filters, grows the list of employers and shows new and changed jobs — with source, update date, salary and language requirements.

C ANALYSIS AND PREPARATION

Clear what to brush up and what to show

Study the requirements and how they changed, match the technologies and experience a job asks for against your own skills, and prepare your CV and answers for a specific employer. Saved jobs are easy to compare side by side.

D APPLYING AND TRACKING

Every step of the search — in one place

You send the CV yourself, and in the app you record the hiring stages, notes, dates and interview outcomes. When you apply, a copy of the job is saved with its requirements and salary as of that date. It stays available even if the listing is changed or taken down.

WORKS WITHOUT YOU

Scheduled auto-search

Set a schedule — and the app **looks for jobs according to your filters** on its own: daily, on weekdays or however suits you. It scans the connected sites, flags new and changed jobs and brings only what actually changed — no searching from scratch.

✓ You set how often: how frequently and when to search — to your rhythm.

✓ The search follows your saved filters and chosen companies exactly.

✓ The result is a summary of new and changed jobs, without the noise.

REQUIREMENTS

+ Kubernetes

- Where the job was found: on a career page, on a job board, on both, or not checked yet.
- A history of changes to requirements, salary and terms — from the very start.
- A freshness mark: “checked today” or “not seen for N days”.

EMPLOYER'S TECHNOLOGIES

Every job found at the employer, in one profile

From the jobs found, a technology profile is built in three groups. You can see how many jobs it's based on, and jump from any item to those jobs.

✓ The technologies the company lists most often.

✓ What's needed in this particular job.

✓ And what shows up at the company in general, but not in this job.

Final round

–

Offer

–

A copy of the job is saved when you apply: the requirements and salary as of Aug 24 stay, even if the listing changes later.

APPLICATION TRACKING

From application to outcome — nothing gets lost

An application is saved in the app together with a copy of the job as it was when you applied. From there you track the hiring stages, notes, dates and interview outcomes.

✓ Stages can be worked in any order — the full history is kept.

✓ Even if the original job is taken down, your application and the saved copy remain.

✓ In-app notifications and a regular summary of changes.

GOOD TO KNOW

Questions that matter

What does “job only on the company site” mean?

–

It's a job found on a company's career page but not found on the connected job boards when checked. That mark is set only after a full check of the boards; if a board was unavailable, it shows “not checked” with a reason. The result is phrased as “not found on the boards when checked on such-and-such date,” not “not on the market.”

Do you promise every job on the market?

+

Where does the data come from and how current is it?

+

How does company monitoring work?

+

How often does the app look for new jobs?

+

Do you send applications for me?

+

How does the app work out a company's technologies?

+

What about salary and languages?

+

Are my applications and notes private?
